PROJECTS

Portfolio

Created a portfolio using HTML and CSS

- A portfolio is a collection of academic and professional resources that demonstrate your values, beliefs, talents, credentials, education, training, and experiences. It reveals information about your personality and work ethic. Choosing the most relevant academic and professional experiences and presenting them in an easily understandable way can demonstrate to potential employer your organizational, communication, and concrete career-related abilities.

Landing Page

Created a Landing Page

- A landing page is an excellent first web development project. It needs a basic understanding of HTML and CSS. This project has taught me how to make columns, separate sections, organize things, and add headers and footers. The most vital part is to use our imagination to create an eye-catching page. Alignments, padding, color palette, boxes, and other aspects were all carefully considered. In brief, a landing page project allows me to put my HTML and CSS talents to work while also stimulating my creativity and assuring a visually beautiful and user-friendly design.
